

GigaDetection:

### 测试数据与提交要求:

我们将提供一张亿像素级超高分辨率图像(分辨率约为  $25000 \times 15000$ )

请大家将 detection 结果保存为名字为 “det\_results.json” 的文件中, 该文件的内容是一个 Python list, 每个 list 包含一个字典用于记录 Bbox 的位置:

```
[
# this is the first detected location
{
  "bbox":[
    10626,
    8656,
    680,
    780
  ]
},
# this is the second detected location
{
  "bbox":[
    30626,
    2656,
    980,
    1080
  ]
},
.....
# this is the final detected location
{
  "bbox":[
    9999,
    7777,
    222,
    333
  ]
},
]
```

# bbox=[bbox\_left, bbox\_top, bbox\_width, bbox\_height] are absolute pixel coordinates without normalization.

# bbox\_left: The x coordinate of the top-left corner of the predicted bounding box

# bbox\_top: The y coordinate of the top-left corner of the predicted bounding box

# bbox\_width: The width in pixels of the predicted object bounding box

# bbox\_height: The height in pixels of the predicted object bounding box

# 注: 该格式与 COCO 比赛的提交格式非常相似(<http://cocodataset.org/>)

**分数计算：**

我们将根据大家提交的结果，使用 AP 和 AR<sub>max=500</sub> 作为评测指标为大家计算得分，最终得分计算规则为：

$$\text{Score} = \frac{2 \cdot \text{AP} \cdot \text{AR}_{\text{max}=500}}{\text{AP} + \text{AR}_{\text{max}=500}}$$

AP 和 AR<sub>max=500</sub> 的具体计算规则请参考：<https://arxiv.org/abs/1405.0312v3>
